

94-0364

The invention relates to the tobacco production, particularly to equipment for treating tobacco leaves after picking them up.

The aim of the invention is to improve the utilization and the convenience of this equipment.

The construction consists of a base 1, a container receiver which consists of 2 parts joined by articulations 2,4 one of them is placed at the entry of the containers and it has a couple of pegs 6, placed on the opposite sides. Each peg 6, represents a lever the end being articulated above the receiver, on the other end having a supporting wheel 7, joined with a mechanism 9 for moving the receiver through the rope-block system.
