

**95-0300**

The invention relates to remedy-prophylactic materials and may be used as a base at materials plasters production.

Summary of the invention consists in application of the adhesive flyseline as the base for mustard plasters production.

The technical result consists in the fact that thanks to the adhesive flyseline porose structure the plasters air peuteration is improved, that preventers the burning and gives the possibility to use them for children treatment.

The adhesive flyseline structure and the possibility to stick together under pressure and temperature action allows to prevent the mustard crumbling during storing, transportation and application thereof.
