The invention relates to games production.

The game contains a cylindrical hollow transparent body, in the upper part of which it is fixed a guiding member with conic openings. The body is closed with a transparent cover and between them with the possibility of rotation about its axis there is installed a partition made in the form of a disk with openings, in the periphery of which it is made a prominence, placed into the slot of the body wall. Into the body there are freely placed play-balls of different colours, on the surface of which there are applied distinctive signs.

The result consists in increasing the attractiveness.
