

a 2002 0235

The invention refers to agriculture, namely to a solution catcher of the blower sprayer.

The solution catcher of the blower sprayer includes shields-screens with solution collectors, suspended to the ends of a transversal beam, mounted above the sprayer blower, ejectors placed inside the collectors. Each ejector is coupled by a discharging pipe-line with the pump and by a suction one with the reservoir of the sprayer. The catcher contains two shields articulately fixed onto the body of the sprayer blower. Onto one of the shields there is made a hole, above which there is placed a pipe in the form of a truncated cone oriented with the greater base downward and joined by a pipe-line with the air ejector, installed into the suction pipe-line.

The result of the invention consists in saving the consumption of spray solution and in providing a stable suction of the caught solution.
