

a 2006 0213

The invention relates to the program control systems and can be used in the creation of the automated state security administration and legal and financial discipline control system.

Novelty of the proposed automated control system consists in that on the basis of irreproducible identification marks it is created an internal administration contour, and the control and accounting of material resources is carried out by comparing the information relating to the documentary identification, circulating over the external administration contour, with the information relating to the objective identification, circulating over the internal administration contour.
