

a 2005 0204

The invention relates to the mechanical engineering and may be used for coupling the shafts of the mechanisms. The fixed coupling comprises two flange half-couplings, embraced by at least two clamps, made in the form of annular sector with the inner radius equal to $1/2$ of the flange diameter and screwed to one of the half-couplings. Onto the adjacent end faces of the flanges there are symmetrically made, in one or more rows, semispherical sockets, wherein there are installed balls.
