

The invention relates to household items, namely to appliances used in the kitchen, in particular to electric kettles. The kettle lid contains a body, wherein is formed an inlet for pouring water, a water partition, movably placed under the said inlet for pouring water, and a closing mechanism, which exerts an elastic driving force on the partition, through which the closing of the inlet for pouring water is carried out, and under the action of the weight of water in the inlet for pouring water through the said partition the opening of the inlet is carried out. The said partition is made in the form of separate sections, each of which is equipped with a fastener on a horizontal bar, placed within the limits of the inlet, and a closing mechanism, placed on the horizontal bar and made in the form of a return spring, with the possibility of setting the partition in motion.
